General Description

The PJ74LVC1G00 is a single 2-input NAND gate. The device is designed for 1.65 V to 5.5 V for V_{CC} operation, it can be driven from either 3.3 V or 5 V devices. This feature allows the use of these devices as translators in mixed 3.3 V and 5 V environments. Schmitt-trigger action at all inputs makes the circuit tolerant of slower input rise and fall times.

The PJ74LVC1G00 performs the Boolean function $Y = \overline{A \times B}$ or $Y = \overline{A} + \overline{B}$ in positive logic. The CMOS device has high output drive while maintaining low static power dissipation over a broad V_{CC} operating range.

The PJ74LVC1G00 is available in SOT23-5 and SC70-5 packages.
